The Domestic Horse

Humans have had a profound influence on the horse since its domestication in the late Neolithic period. Used for transport, labour, food and recreation, horses have become important in many facets of our society. Daniel Mills and Sue McDonnell have produced an exceptional account of our current knowledge of the development and management of the behaviour of the horse, from its wild roots. The Domestic Horse, first published in 2005, brings together, for the first time, an unrivalled collection of international scientific authors to write on the latest findings concerning the behaviour and welfare of this beautiful animal. Illustrated throughout, The Domestic Horse will appeal to animal scientists, those working with horses in a professional capacity and the owner/enthusiast. It also provides sound complementary reading for animal/equine science courses and veterinary students.

The Percheron Horse in America

Using Science to Improve the BLM Wild Horse and Burro Program: A Way Forward reviews the science that underpins the Bureau of Land Management's oversight of free-ranging horses and burros on federal public lands in the western United States, concluding that constructive changes could be implemented. The Wild Horse and Burro Program has not used scientifically rigorous methods to estimate the population sizes of horses and burros, to model the effects of management actions on the animals, or to assess the availability and use of forage on rangelands. Evidence suggests that horse populations are growing by 15 to 20 percent each year, a level that is unsustainable for maintaining healthy horse populations as well as healthy ecosystems. Promising fertility-control methods are available to help limit this population growth, however. In addition, science-based methods exist for improving population estimates, predicting the effects of management practices in order to maintain genetically diverse, healthy populations, and estimating the productivity of rangelands. Greater transparency in how science-based methods are used to inform management decisions may help increase public confidence in the Wild Horse and Burro Program.

Using Science to Improve the BLM Wild Horse and Burro Program

Originally published in 1980 and here re-issued with an updated preface, this book deals with the role of the horse in the societies of West Africa during the pre-colonial period. It traces the history of its introduction and its diffusion within West Africa, and examines the problems of maintaining horses in such a harsh environment. The use of horses in warfare is analysed but the non-military aspects of the West African horse culture are also discussed, principally the use of horses as tokens of status and wealth. The book includes a review of the decline of the West African horse culture in the 20th century, reflecting the passing of a political system based on warfare and slavery.

Goshute Herd Unit Emergency Horse Removal, White Pine County, Environmental Analysis Record

This is a textbook for an introductory combinatorics course that can take up one or two semesters. An extensive list of problems, ranging from routine exercises to research questions, is included. In each section, there are also exercises that contain material not explicitly discussed in the preceding text, so as to provide instructors with extra choices if they want to shift the emphasis of their course. Just as with the first edition,

the new edition walks the reader through the classic parts of combinatorial enumeration and graph theory, while also discussing some recent progress in the area: on the one hand, providing material that will help students learn the basic techniques, and on the other hand, showing that some questions at the forefront of research are comprehensible and accessible for the talented and hard-working undergraduate. The basic topics discussed are: the twelvefold way, cycles in permutations, the formula of inclusion and exclusion, the notion of graphs and trees, matchings and Eulerian and Hamiltonian cycles. The selected advanced topics are: Ramsey theory, pattern avoidance, the probabilistic method, partially ordered sets, and algorithms and complexity. As the goal of the book is to encourage students to learn more combinatorics, every effort has been made to provide them with a not only useful, but also enjoyable and engaging reading.

The Everything Horse Book

First Published in 1967. This is volume one of three of The History of Four-footed Beasts taken principally from the 'Historie Animalium' of Conrad Gesner. During the first decade of the seventeenth century, when Topsell prepared his translation, zoology had just become a science. It has a unique place: It was the first major book on animals printed in Great Britain in English; and it appeared at the last moment in history when all zoological knowledge since antiquity could be summarized sympathetically, before it was rendered a curiosity by the many new discoveries soon to come.
