Initial effervescence due to expansion of air in the test tube.

Hence limewater remains clear.

Heat is needed to overcome the activation energy.

White ppt starts to appear in the limewater.

The mixture glows as the reduction reaction is exothermic.

A lot of carbon dioxide is produced.

Then remove the test tube from the flame.
The solid appears pink/reddish brown after the reaction.

Reduction of Copper Oxide, (Cuo,) in the presence of ...

A test tube containing copper oxide, and carbon, is ...

PROCEDURE: Measure about 2.4 g of copper oxide.

Mix the powders gently but thoroughly, and pour into the test tube.

Light the burner, which is about a centimeter below the test tube.

At first, the bubbles are due to the expansion of the air in the reaction tube.

But, the bubbles speed up as carbon dioxide is produced by the reaction.

The lime water gets cloudy as the carbon dioxide reacts with dissolved calcium hydroxide to make insoluble calcium carbonate.

The reaction tube is then vented through the universal indicator, which changes color as the CO2 dissolves to form carbonic acid.

The acceleration of the bubbling indicates that the reaction is about to peak.

The glow and heat is not from the flame, but from the heat of this highly exothermic reaction!

The bubbling stops as the reaction reaches completion.

The reaction products are processed by cleaning with hydrochloric acid and rinsing with water.

The waste fluids are decanted.

The processing leaves behind the solid metallic copper.
